

300 °C

This scanning electron micrograph (SEM) shows a material surface after heating to 300 °C. The surface is characterized by a dense, granular texture. A prominent, elongated, and somewhat irregular feature is visible in the lower right quadrant. A dashed line with 'x' markers at both ends is drawn vertically next to this feature, indicating a specific measurement or scale. The overall appearance suggests a surface that has undergone significant morphological changes due to the thermal treatment.
